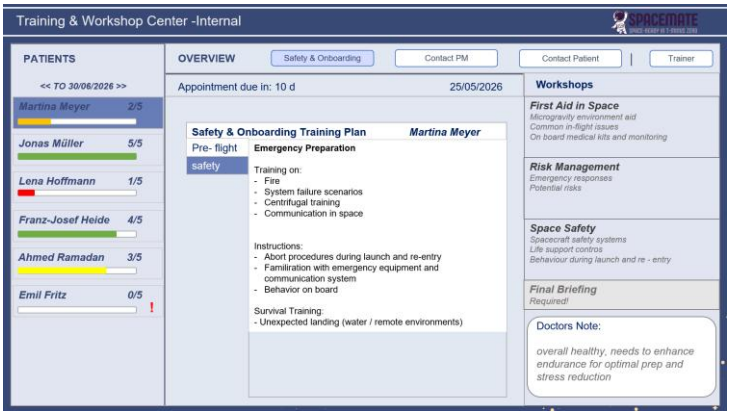
Trainer – UI Mockup

This page represents the Space Mate user interface from the perspective of the **Trainer**.
It shows how scheduling, preparing customers for a flight in terms of safety and health and coordination can be supported by our system.



This interface supports defining and overseeing a patients safety and onboarding preparation for space-related activities. It includes structured training content to ensure that the patients are prepared for flight and possible critical situations.

The central area presents a detailed preparation plan, focusing on emergency readiness, but also communication in space. It outlines key instructions for behavior during launch, re-entry and unexpected situations.

On the right, relevant workshops such as risk management and space safety are displayed, giving additional context on training areas, the customers must cover. A short medical notices provides overall assessment and highlights improvement needs for the selected customer.
This is needed, when the trainer wants to schedule tailored training plans, if the doctor found out it should be done pre-flight:

In this area, the Trainer now creates tailored plans, based on the Flight Doctors finds. (listed on the right side).The trainer gets the patients situation and can create the training plan based on the actual needs of the patient. The section below the fat text (e.g Lifestyle 85% , which is given from the doctor) is used for notes for the personal trainer (e.g“higher protein nutritioning”), before putting it together in the center.
This part only takes place if it is required, by doctors recommendation, not per default.

In the central section, the doctor specifies detailed exercise routines, including frequency, intensity and recovery phases, ensuring the training is safe and aligned with the patients needs.
